

Water Treatment Systems

Aquasource (SW) Ltd have all the knowledge and expertise to specify, supply, install and maintain the correct water treatment system for your private water supply.

This can range from simple filtration to remove silt particles and Ultra Violet (UV) Sterilisation to a full system package of bespoke filtration to remove iron and manganese and other contaminants.

Systems installed in granite areas will normally also need pH correction to ensure that the water is as close to neutral as possible.

We supply a full package from sampling the water to detailing and supplying and installing the water treatment system required.

We supply this service to customers with boreholes, wells, springs and in some cases mains water supplies.

Water Treatment Servicing and

Callouts

We have a number of service engineers available for routine servicing and call outs. At the point of installation we will recommend a service interval and will ring you a week or so before water filtration servicing is due.

In many cases if you have an urgent problem with your borehole or filtration we can get someone out to you on the same day!

All our engineers are employed in-house and are fully trained.

More more details please ring Dave on 01726 824837 or [email](#).
